FIFTIETH ANNIVERSARY
KELSEY NURSERY SERVICE

(1878 to 1928)

Kelsey Nursery Service

1. **We furnish high quality stock.** Kelsey Nursery stock is grown where it grows best; always, of course, with regard to shipping convenience. Of more than seventy nurseries with over twenty thousand acres of stock we select the nearest nursery growing the material of the quality and grade you may want.

2. **We furnish our stock at the lowest prices made possible by mass production.** Prices of nursery stock vary greatly. One nursery grows stock on land worth, say, \$4,000 or \$5,000 per acre. The stock is no better than that grown at a nearby nursery where land is worth perhaps \$400.00 per acre. Nature has no partiality in this respect. We are, therefore, enabled to sell excellent stock at very low prices.

3. **We are an entirely responsible source of supply.** Established Fifty Years ago, in 1878, we still have among our customers many who have been patrons for forty years or more. In all our dealings we are always willing to make things right on any errors or just causes for complaint.

4. **Our Guarantee**—Stock to be in good condition when furnished. We will, however, replace any and all losses at half price.

5. **Scarce and rare varieties:**—Why look through a dozen nursery catalogues for them? Send us your list and we will quote promptly. This Short Guide is necessarily confined to standard varieties, but with our facilities we can furnish almost any variety or size grown in the United States.

Large Specimens—We have them and will gladly quote on request.

CONSULT US BEFORE BUYING

Supplying all young stock in quantity for reforestation and for nursery planting on the most favorable terms is one of the important and well-known features of the KELSEY NURSERY SERVICE. That these facilities are more and more appreciated by past and prospective patrons is shown in our constantly increasing business.

It is, therefore, advantageous, especially where material quantities are required, to get in touch with us before making purchases.

Throughout this list, 5 will be supplied at the 10 rate, 25 at the 100 and 250 at the 1000 rate.

FIFTY YEARS—

THIS page is a record in brief of fifty years successful business. In 1878 Mr. Frederick W. Kelsey, president of the company, founded the business which was to continue for a half century—and still remains—a growing business. To our many customers, some of whom have been patrons of this company almost since the first year, we offer increased facilities to give entire satisfaction.

THE Rhododendrons pictured above are twenty feet high and were furnished by us more than thirty years ago. Photographed June, 1927. Some of the finest plantings of Rhododendrons in the East have been furnished by this company. On page 10 appears a planting of Shade Trees of even greater antiquity. Similar pictures appear on pages 4 and 16.

THE evergreens above were snapped by a customer last summer and although the picture is imperfect and required to be "touched up" we printed it to show the shapely and bushy growth. Twelve years ago we furnished these evergreens—small ones, but so grown and cared for that when set out they grew into specimens.

Mr. Fred'k. W. Kelsey
President

Rhododendrons have been among our specialties since 1878. The above pictures show our exhibit and Award of Merit at the World's Columbian Exhibition held at Chicago in 1893.

EVERGREENS

Evergreens, even rare varieties, are dependent for their value on two things—their root system and the shape of their tops. Root systems are thin or bushy depending on how many times the tree has been transplanted. We have some very inexpensive evergreens listed in the green list at the back of this book and also on page 7. They are only once or twice transplanted and their growth has not been shaped and trained. The list below and on the following pages refers only to many times transplanted stock carefully grown and handled. Many sizes are not listed as well as many little known varieties for which the demand is small. However, we can furnish in all probability anything you want and will gladly quote prices on anything not here listed.

Hardy Hybrid Rhododendron in front, rose white blooms of the native Maximum show in the rear

RHODODENDRONS
(Shade—acid soil)

ONE of our specialties since 1878 has been furnishing native Rhododendrons in carlots. Our distribution point is now not far from New York, so that freight is comparatively inexpensive.

Some of the finest estates in the east have been furnished with Rhododendrons exclusively by this Company and we have been repeatedly commended on the quality of our stock.

WHEN TO PLANT

Both Forestry Stock and other young Deciduous Trees and Evergreens are successfully planted both in Autumn and Spring. Evergreens for Spring planting April to June, and Deciduous Trees through March, April and May. The present season promises to be a favorable planting season.

HOW TO PLANT

The roots of smaller trees, seedlings or transplants, like larger trees, should never be permitted to dry out, and in planting it is desirable that each tree be set a little deeper than as grown in the nursery. It is also important to have the earth pressed firmly over the roots after they are placed in natural position. For forestry or timber growth, trees are generally planted anywhere from 4 to 6 feet apart each way; planted 4 x 4 feet in the rows, 2,720 trees are required per acre; if 5 x 5 feet 1,740; if 6 x 6 feet, 1,210 per acre. Transplants as a rule are more satisfactory for forestry or lining out purposes than seedlings. In this planting two men make an effective team at low cost: One man to open the hole, the other man to follow and plant; the trees being carried in a pail of muddy water until planted.

PLANTING COSTS

The economic side of the planting of young trees is, perhaps, not generally understood. A yearly income of 15 to 20 per cent on an investment in reforestation is well within the bounds of possibility if ordinary care and intelligence are exercised. This investment would, of course, be a long-term one of 20 to 50 years.

The cost of planting is made up by reckoning the value of the land, the yearly taxes, the cost of labor in planting and the cost of the trees themselves. All these factors are variable, except that the actual labor of planting should average about \$12.00 per acre. The number of trees per acre in a 6 x 6 foot planting is 1,200, and in an average planting of Pine and Spruce these would cost for three-year transplants \$25 to \$35 per acre. Seedlings would, of course, be much cheaper and more economical, but require

A barren hillside—six years after planting

too much care on the average private estate where reforestation is purely a minor item and taken up as much for pleasure as for profit.

A typical cost budget per acre might be as follows:

Cost of land	\$10.00 (variable)
Taxes at .50c per year for 40 yrs.	20.00 (variable)
Cost of trees	30.00
Planting	12.00
Total	\$72.00

PROFIT FROM TREES

As against this cost the timber at the end of thirty years—in Spruces, Pines or Firs, should yield about 15,000 board feet at from \$6 per thousand for Pine up to \$12 per thousand for Spruce and Fir, or \$90.00 to \$180.00 total income per acre.

If cut for pulp-wood instead of lumber, the yield should be 30 to 45 cords per acre—at about \$4.00 per cord, or \$120.00 to \$180.00 per acre.

At 40 years of age the board feet would range from 30 to 40 thousand feet per acre and the cords of pulp-wood also approximately double the figure for 30 years. For this reason 40 years is a much more economical period to crop the timberland.

The planting of White and Norway Spruce and Douglas and Balsam Fir for Christmas tree cutting is another phase of commercialized forestry which is profitable. This crop usually matures in about 12 years, and when cut, leaves the timber-plot properly spaced for forest growing. One tree is planted between each permanent tree and requires no extra land; indeed it is an assistance to the young evergreen for the first ten years to have the shade and shelter of a dense planting, which must, however, be cleared away in time, whether for Christmas tree use or not, in order to maintain a six by six foot space for permanent growth.

BEST EVERGREEN VARIETIES

A few words about the commoner varieties might not be amiss. In the price list of Seedlings and Transplants in the back of this Guide will be found many varieties of Evergreens, Trees and Shrubs classified alphabetically according to botanical names, together with sizes and prices available for sale.

NORWAY SPRUCE (*Picea excelsa*)—This variety is planted in preference to other spruces for two reasons: It will thrive when set out in dense shade and succeeds in heavy damp soil. Having a flat root system, it is suitable for shallow, rocky soils.

WHITE SPRUCE (*Picea alba*) is most suitable for paper pulp and succeeds wherever Norway Spruce succeeds. It is a trifle quicker in growth.

TRUMPET VINE (*Bignonia radicans*)

—orange flowers in July; clings to rough surfaces, 2 year, number 1	3.50	30.00
---	------	-------

DOUGLAS FIR (*Pseudotsuga taxifolia*) although more beautiful probably than the average forestry tree is very valuable for timber. Fairly quick growing, it is a highly desirable variety and thoroughly hardy.

EUROPEAN LARCH (*Larix Europea*) entirely different from our American species, this variety makes an excellent growth and the wood is very strong and durable. It requires a deep, fairly porous and moderately fresh soil. It is a rapid grower but needs sunlight. Best used in combination with other varieties.

SCOTCH PINE (*Pinus Sylvestris*) is the variety par excellence for poor soils—even dry sand wastes can be successfully covered with a thrifty stand of Scotch Pine. It is also the quickest growing pine in common use and this even on the most sterile soil.

WHITE PINE (*Pinus strobus*) is probably the most valuable timber tree, but must have a fairly good soil for best results.

RED PINE (*Pinus resinosa*) is perhaps the most popular pine for forestry planting in the east. It has practically no insect enemies and is successful on a wide range of soil—from coarse gravel to heavy clay.

CHRISTMAS TREE GROWING—This is particularly profitable in connection with a forest planting for pulp. Plant 3 x 3 feet—about 4,850 trees to the acre. At the end of approximately ten years take out every other tree for sale as Christmas trees, and leaving your planting 6 x 6 feet—the best distance for good timber growth. The best Christmas tree varieties are Spruces and Firs.

Woods planting need not lack beauty

A remarkable picture. Above is taken in the same spot after 25 years of growth (White Pine)

CONSERVATION—All nature depends on the green leaf. Restore the forest and you restore nature. American Holly (*Ilex Opaca*) and Mountain Laurel (*Kalmia*) are fast disappearing from our woods. We offer small sizes for woods planting under Evergreen Shrubs in the green list opposite. Many shrubs whose berries provide winter food for birds are also noted therein.

<i>polita</i> (Tigertail Spruce)	(100)	(1000)
4 to 6 in. X.....	14.00	125.00
<i>pungens</i> (Colorado Blue Spruce)		
This variety varies in color from light blue to light green. Unless stated "Selected Blue" our stock runs from 30 to 50% blue. In small sizes, it is usually cheaper to buy unselected trees. Even seed from the Koster blue Spruce does not make all blue seedlings.

RARE AND SCARCE EVERGREENS, LAWN TREES AND SHRUBS

To answer the demand for the more unique varieties of plants in small quantities suitable for private plantings, and for those who wish to make a valuable collection, we are offering true grafted varieties of these interesting trees, etc., in lots of 10 or more (5 at the 10 rate).

The grafts listed will be ready for shipment about May first and will be well hardened for safe planting in the open.

These rare varieties will be worth from five to ten times their present value in a few years. Why not plant them in the smaller grades when they can be purchased at reasonable prices?

Prices will be found in the Forestry List commencing on the opposite page and under the following headings:
